

ELECTRIC TRUCK ASSEMBLY

From CKD Components to a Road-Ready Electric Truck

Assembly Location: Kenya Vehicle Manufacturers (KVM), Thika, Kenya

Overview

Our electric trucks are brought together through a structured local assembly process at Kenya Vehicle Manufacturers (KVM) in Thika. The process transforms supplied CKD (Completely Knocked Down) components into a fully assembled vehicle through a sequence of mechanical, electrical, drivetrain, body-fitment and quality-control operations.

The assembly approach combines established automotive manufacturing practices with electric mobility technology, supporting local technical capacity, quality assurance and the development of Kenya's electric commercial-vehicle ecosystem.

The Assembly Journey

01

Chassis & Running Gear Assembly

The process begins with the vehicle chassis and running gear. Axles and wheel assemblies are installed, followed by the front and rear suspension systems. Steering components, including the steering gearbox, are fitted and aligned. Piping and wiring harnesses are then routed and secured to prepare the platform for the next stage.

02

Powertrain, Drive & Cooling Integration

With the rolling chassis prepared, the electric powertrain and drive-related components are installed. The propeller shaft and associated drivetrain components are fitted where applicable, while the cooling system is installed to support reliable operation of the vehicle's powertrain and associated systems. Connections are checked as the assembly progresses.

03

Cabin, Exterior Fitment & Final Inspection

The final stage brings the truck together as a complete vehicle. Bumpers and other external fittings are installed, the cabin is decked and completed, and the assembled truck undergoes

final inspection. This stage verifies fitment, workmanship and overall vehicle readiness before release.

What This Means for Our Customers

- **Local Assembly:** Electric trucks are assembled in Kenya at the KVM facility in Thika, bringing manufacturing activity and technical skills closer to the market.
- **Structured Quality Process:** Assembly progresses through defined stages; from chassis preparation and drivetrain integration to body completion and final inspection.
- **Commercial-Vehicle Focus:** The process is designed around the practical requirements of electric commercial vehicles, including robust running gear, drivetrain integration and system readiness.
- **After-Sales Readiness:** A structured assembly process supports better understanding of the vehicle platform, helping build local technical capability for inspection, maintenance and support.

KVM refers to Kenya Vehicle Manufacturers. The KVM assembly facility is located in Thika, Kenya.
